  res = results(dds, contrast=c("condition", "hoxa1_kd", "control_sirna"))
     Q. Call the summary() function on your results to get a sense of how many genes
     are up or down-regulated at the default 0.1 p-value cutoff.
  summary(res)
out of 15975 with nonzero total read count
adjusted p-value < 0.1
LFC > 0 (up)
                    : 4349, 27%
LFC < 0 (down)
                   : 4396, 28%
outliers [1]
                    : 0, 0%
low counts [2]
                    : 1237, 7.7%
(mean count < 0)
[1] see 'cooksCutoff' argument of ?results
[2] see 'independentFiltering' argument of ?results
  plot( res$log2FoldChange, -log(res$padj) )
```

Q. Improve this plot by completing the below code, which adds color and axis labels

Make a color vector for all genes

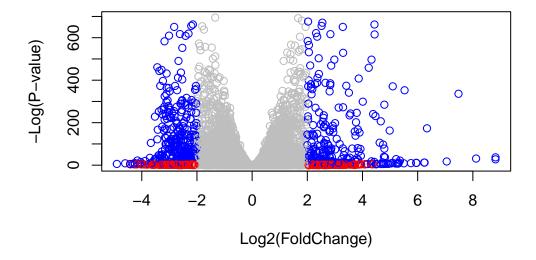

```
mycols <- rep("gray", nrow(res) )

# Color red the genes with absolute fold change above 2
mycols[ abs(res$log2FoldChange) > 2 ] <- "red"

# Color blue those with adjusted p-value less than 0.01

# and absolute fold change more than 2
inds <- (res$padj < 0.01) & (abs(res$log2FoldChange) > 2 )
mycols[ inds ] <- "blue"

plot( res$log2FoldChange, -log(res$padj), col=mycols, xlab="Log2(FoldChange)", ylab="-Log(</pre>
```

Q. Use the mapIDs() function multiple times to add SYMBOL, ENTREZID and GENENAME annotation to our results by completing the code below.

```
library("AnnotationDbi")
```

Warning: package 'AnnotationDbi' was built under R version 4.3.2

```
library("org.Hs.eg.db")
```

columns(org.Hs.eg.db)

The top two here (hsa04110 and hsa03030) appear to be the main sets picked out. I will now use pathview() to pull these pathways and color up my genes that intersect with these two pathways.

```
pathview(gene.data=foldchanges, pathway.id="hsa04110")

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/nicolenashed/Desktop/R Coding/Class14

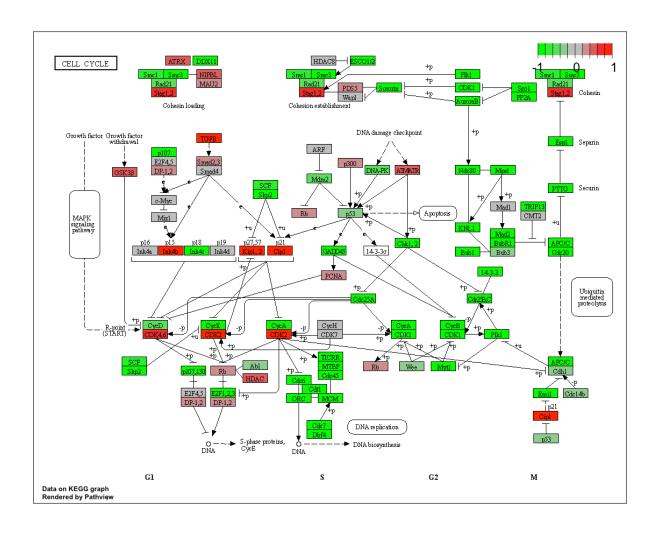

Info: Writing image file hsa04110.pathview.png

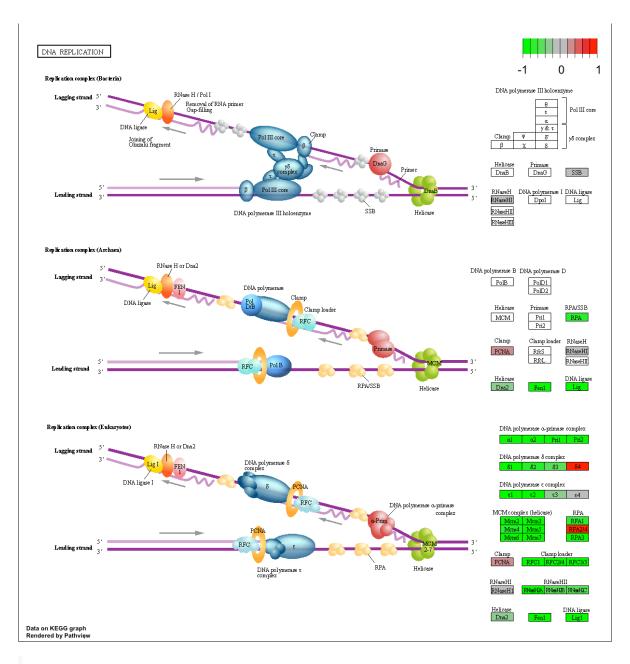

pathview(gene.data=foldchanges, pathway.id="hsa03030")

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/nicolenashed/Desktop/R Coding/Class14

Info: Writing image file hsa03030.pathview.png
```

pathview(gene.data=foldchanges, pathway.id="hsa04110", kegg.native=FALSE)

'select()' returned 1:1 mapping between keys and columns

Warning: reconcile groups sharing member nodes!

##Section 4. Reactome Analysis

We can use reactome as either its (original) R package or via its newer online webserver. The later has some potentially useful pathway viewing functionality so lets try it out online. (https://reactome.org/)

To use it online we need alist of significant genes at the alpha < 0.05 level as a plain text file. We can make this in R like this:

```
sig_genes <- res[res$padj <= 0.05 & !is.na(res$padj), "symbol"]
print(paste("Total number of significant genes:", length(sig_genes)))</pre>
```

[1] "Total number of significant genes: 8147"

```
write.table(sig_genes, file="significant_genes.txt", row.names=FALSE, col.names=FALSE, quo
```

Now upload this here (https://reactome.org/PathwayBrowser/#TOOL=AT).

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

The cell cycle, Mitotic is the highest and it has the lowest p-value and the cell cycle pathways are the ones that match the previous KEGG results. The size of the database could cause many variations between the two methods and it also depends on how they annotate each one.
